RecipePro: Cook With What You Already Have

Portfolio case study · Built by Zain · Web application · Next.js, React, TypeScript, Tailwind CSS

Overview

RecipePro is a recipe and beverage platform that works backwards from the fridge. Instead of choosing a dish and then shopping, the user picks the ingredients they already have, and RecipePro builds a complete recipe around them, with exact quantities and step-by-step instructions.

The platform is organised into three studios, each tuned for its craft: **Food Studio**, **Tea Studio** and **Coffee Studio**.

The problem

Most recipe sites start with a dish. That fails the common real-life situation: a few ingredients on hand and no idea what to make. Tea and coffee make this worse, because quality depends on exact water temperature, steeping time, brew method and ratio, details that general recipe sites rarely handle well.

The solution

- **Food Studio:** choose fruits, vegetables and herbs, pick a salad, smoothie, snack or meal, set the servings, and get scaled quantities and instructions.
- **Tea Studio:** choose a tea type, water temperature and steeping time, then follow a countdown timer.
- **Coffee Studio:** choose a brew method (espresso, pour-over, French press and more), roast level, strength and ratio.
- **Explore, search and categories:** browse recipes by studio, difficulty and prep time, with an ingredient library and detailed recipe pages.
- **Recipe pages:** serving scaling, cooking mode, share and print.
- **Admin console:** a protected area for managing recipes, ingredients, categories and featured content.

Design

The interface uses a glassmorphism style: frosted translucent panels over soft gradient backgrounds, in a palette of forest green, lime and cream, with warm browns for coffee. Typography pairs Inter for reading with Manrope for headings.

- Scroll-reveal animations, floating glass cards on the hero, hover lift on cards and image zoom effects
- Scroll-progress bar and back-to-top button
- All motion switches off for users who prefer reduced motion
- Real photographs throughout, with an automatic fallback to a photo of the right category if an image fails to load
- Fully responsive from phones to large monitors, with touch-sized buttons and print-friendly recipe pages

Engineering highlights

Performance

- Recipe, category and ingredient pages are pre-built with static generation
- Responsive image sizes, lazy loading and a shimmer placeholder
- Preloaded fonts, a preconnect to the image CDN and long-lived caching for static assets

SEO

- Unique titles, descriptions and canonical links on every page
- Recipe structured data (JSON-LD) for rich search results
- Sitemap, robots file and web app manifest
- Private pages (login, dashboard, admin) hidden from search engines

Security

- Admin console protected on the server with a signed, HttpOnly session cookie and middleware
- Login attempts rate limited
- Content-Security-Policy and other strict security headers
- Recipe API with strict typed validation, request size limits and rate limiting

Quality

- TypeScript throughout, with a clean type check and production build
- Unit tests for the recipe engines, store and admin logic (25 passing)

Tech stack

Area	Tools
Framework	Next.js 15 (App Router), React 19
Language	TypeScript
Styling	Tailwind CSS, custom glassmorphism and gradient design system
Validation	Zod
Icons	Lucide
Testing	Vitest
Backend (next)	Supabase

My role

I led the product direction for RecipePro, from the three-studio concept and visual identity through to the performance, SEO and security upgrades, and I assembled the project end to end.

What's next

Supabase powers the next stage of the project: user accounts, saved favourites and shared creations, alongside a larger ingredient library and more recipes in every studio.
